Household Plants To Avoid

Plants clean and purify the air we breathe and they also serve as inexpensive and attractive decor. One might think that all plants are a good fit for any office or home, but the truth is that many of them shouldn't be on your list of plants to buy. Some plants are known for triggering skin rashes, pest problems, allergy issues, and being highly toxic to humans and animals alike. Below you will find some common indoor plants that are bought for offices and homes, and the negative toll they can have on you, your coworkers, your family and even your pets.

Pothos/Devil's Ivy Epipremnum aureum

Key Issues: Toxic to humans and animals
They are one of the most popular indoor plants and have proven to be one of the best at purifying the air we breathe as well. Unfortunately, the plant is somewhat toxic, especially to pets. If you accidentally ingest it, it can cause irritation, swelling, vomiting and diarrhea. For pets, it can be much worse: choking, swelling, difficulty breathing, and even renal failure or death, according to the ASPCA.

Dumb canes Dieffenbachia

Key Issues: Toxic to animals
Although it's a common indoor plant, it is not a good fit if you have pets. These plants contain calcium oxalate, which, if ingested by cats or dogs, can cause severe burning and swelling of the mouth or even death according to Poison Control.

Oleander Nerium oleander

Key Issues: Toxic to humans and animals
This shrub-like plant provides beautiful pink flowers that are hard to miss. According to the U.S. Dept. of Medicine, Oleander is highly toxic to both humans and animals alike, causing severe vomiting, lightheadedness, and even heart block. Some have even died from ingesting the plant. So if you find yourself enjoying the plant's beautiful flowers, be sure to keep at arm's length.

Household Plants To Avoid (cont.)

Spider/Snake plants Chlorophytum comosum

Key Issues: Allergies

These plants are a great choice for any indoor environment, inexpensive, bright green, easy to maintain and have a strong ability to purify the air. The only problem is that these plants are an allergy sufferer's worst nightmare. Exposed on a daily basis, you start noticing allergy-like

symptoms then it's time to say your farewells to the plant.

Jade Plant Crassula ovata

Key Issues: Toxic to animals

This is a great plant for beginners, very easy to grow unless you have pets. Your furry animals can suffer from vomiting, decreased heart rate and depression.

Easter Lily Lilium longiflorum

Key Issues: Toxic to cats

These elegant flowers will surely make many heads turn and delight those with a good sense of smell. But to cats, which are known to be curious, especially to newfound smells, things don't turn out so great. You'll most definitely find your feline friend experiencing vomiting, lethargy, kidney failure, or death if it's ingested.

English Ivy Hedera helix

Key Issues: Toxic to humans and animals, Skin reactions

Even though a mere 1 out of 10,000 people are allergic to them Poison Control warns that their leaves may cause skin reactions and when ingested by humans, can be mildly toxic. Animals and children may vomit, have diarrhea, or develop neurological conditions.
